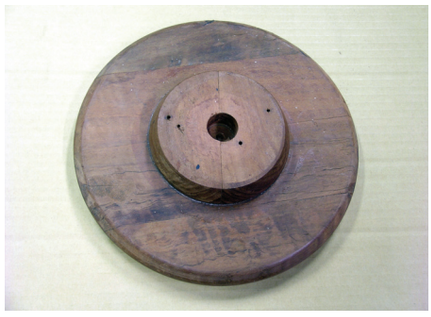
The original top

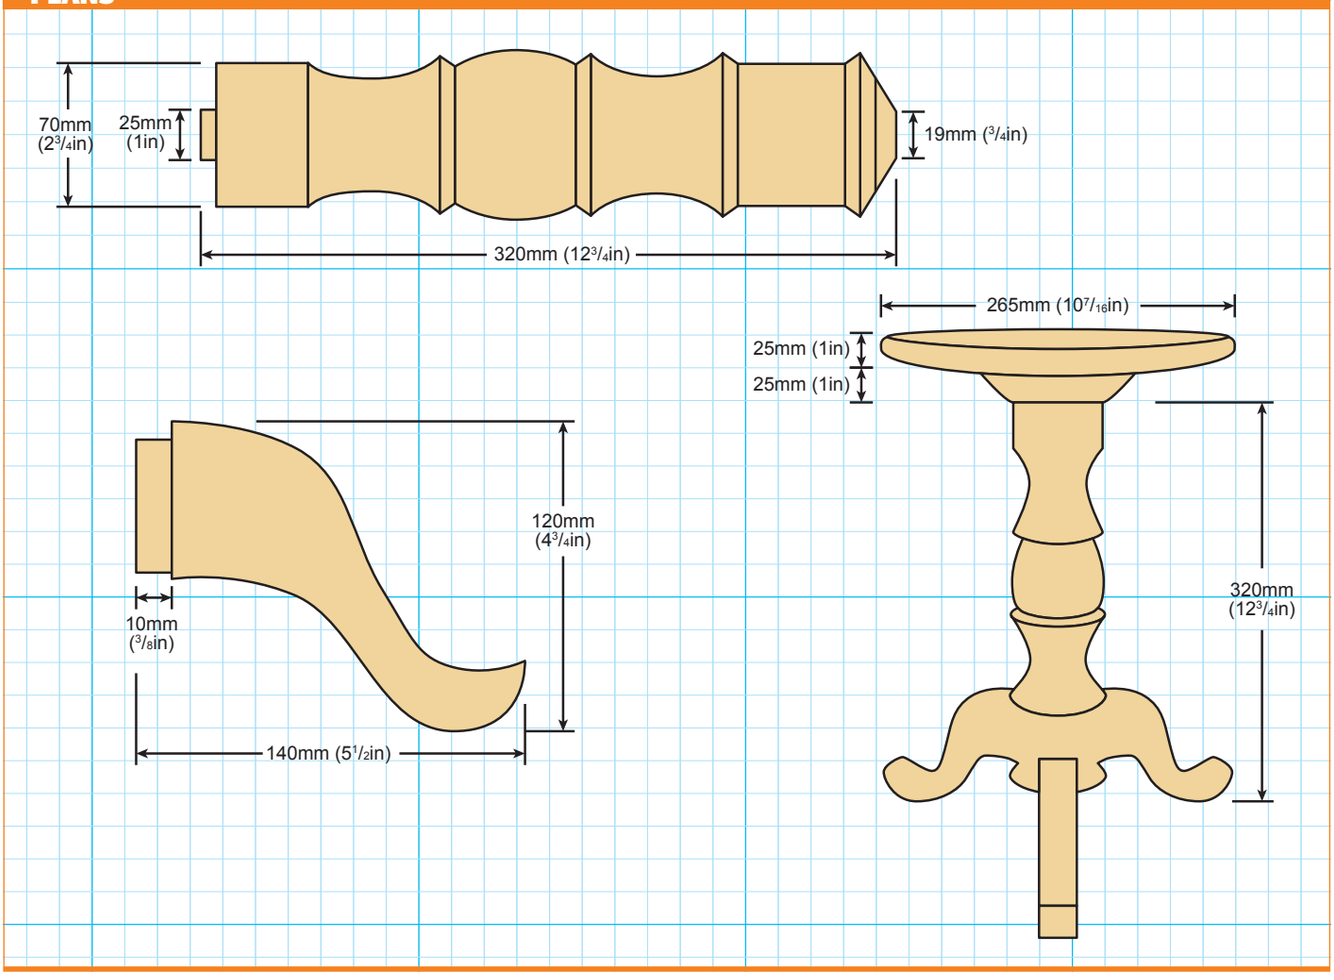


The underside of the original top

EQUIPMENT USED

CA glue
Abrasives
25mm chisel
Polyurethane finish
Epoxy resin
PPE: facemask, respirator/dust mask and extraction

PLANS



1 First of all, there were a number of cracks that I had to fill with CA glue, before deciding how I would mount the top. I also needed to figure out the most accurate method of finding its centre, and waste as little material as possible in trimming it down. There was a 25mm diameter hole already drilled to suit a tenon of the same size on the existing stem

2 The solution was to turn a plug identical to the hole, create a centre point before parting it free and inserting it into the hole
