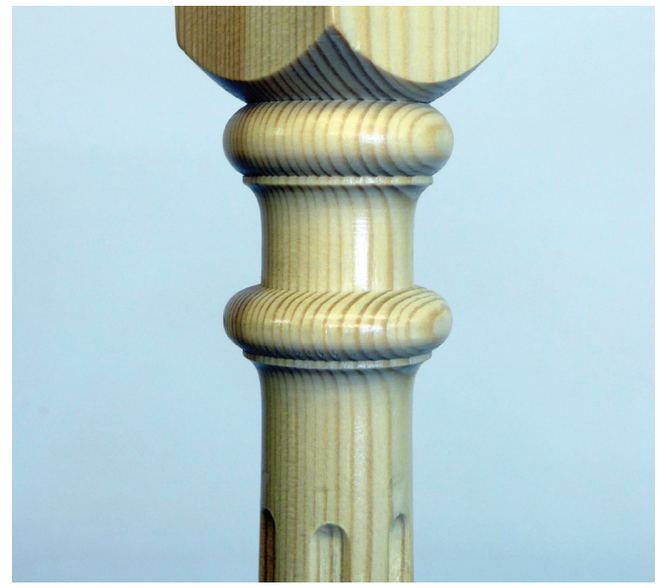
Other common details

You may come across the term 'bird's beak' which could be confusing until you see the turned shape next to an actual bird's beak, at which point it becomes very clear! Here you will see a turned bird's beak, used on the oak lamp, next to an eagle.

A necklace detail is one used near the top of a spindle, just set down from the top detail, as shown on the softwood spindle in the picture. It usually involves a bead of some sort.

There are also other terms used to describe a bold feature detail on spindle work, such as trumpet shaped, heart shaped, onion shaped and urn shaped, all of which are quite literal translations of common forms used as wood turned features.

Bird's beak detail



Necklace detail on a stair spindle, set down from the square pommel and first detail

Shown next to an actual bird's beak, the description becomes clear
