AURIOU LARGE AND SMALL ROTARY RASPS

These hand cut rotary rasps will cut (not burn) your wood quite precisely. The small rasp (50mm) works well on Arbortech-type long angled grinders. The larger rasp (125mm) is not for the faint hearted or inexperienced sculptor: this is for fast aggressive stock removal using a good quality angle grinder. The hand-cut teeth act like hundreds of small plane blades, efficiently cutting tiny shavings from your wood. Once you have mastered these rasps, you will be pleasantly surprised with the speed at which you can shape your work. All necessary safety precautions need to be taken when using rotary tools. Classic Hand Tools provides free shipping on these items in the UK.

JET AIR FILTRATION SYSTEMS

The AFS-500 is a medium to large workshop filter unit with the advantage that it can be positioned anywhere in the workshop: on a bench, shelf or suspended from the ceiling. The unit is easy to operate with three speeds which can be simply activated by the push of a button or by using the convenient remote control. It should be mounted away from ventilation and heating vents, and is only suitable for non-metallic dust particles. The unit can be positioned either vertically or horizontally to best utilise the space available. It is fitted with a pleated cloth main filter and an electrostatically charged pre-filter. An optional charcoal filter is available which will neutralise odours and harmful organic fumes and also refresh the air by removing smoke, dust, bacteria, pollen and other harmful microscopic particles. For best results the AFS-500 should be left running for a few minutes to clean the air after your machines have been switched off, or use the built-in timer options to run the filter after you leave the workshop.

With a powerful input 200W motor, the AFS-1000 B is intended for bigger, more commercial workshops. It needs a secure mounting, capable of holding a 40kg static load, at least two metres off the ground. The air passes through the electrostatic pre-filter into the main pleated filter, filtering 98% of all particles five microns in size and 85% of all particles 1 micron in size. The remote control unit has three settings for the motor speed and three different time settings, which can be used to clear the workshop after work has finished for the day. An optional charcoal filter is available, which will neutralise odours and harmful organic fumes or particles including pollen. A handy ceiling mounting kit consisting of four lengths of flexible stainless steel wire with screw eyes and bolt-up crimps allows the machine to be positioned out of the way.

NEW 'MASTERING WOODTURNING' DVD

In Glenn Lucas's new DVD he shows how to make a traditional Irish platter. With plain explanation and clear camera work, the viewer just wants to run to the lathe and get started on this project. As with all of Glenn's videos, there is a great deal to assist the turner, gained from years in production and teaching: tips on wood selection, stance at the lathe, correct tool use and applying finish. The detailed skills shown can be applied to turning bowls too. Glenn has found his videos about techniques, for instance, how to sharpen, are well received and he is introducing many new projects in this 'how-to-make' series. The DVD can be downloaded to your computer and shared with your other devices, so you can have this resource beside you at the lathe, or bought in hard copy.
